

Kwik-Dex Indexer

Programmable Indexer

The Kwik-Dex programmable indexer is used to streamline your production by indexing parts to the marking area of the marker. This allows an operator to load/unload the dial while the machine is marking. Make your own dial or order from us. Unlike a “generic” solution, this system includes an integrated clamp at the marking position.

Features

- No controller needed. Driven from marker's own software
- The Kwik-Dex is ideal for families of products and fits onto the optional T-Slot table
- Dial mount 2 ream and 2 tap holes and dial mount center pilot
- Heavy duty thrust bearings and brushless programmable motor
- Mounts directly to the Kwikmark optional T-Slot Base
- Quick connect to marking machine, using one cable
- Built in pneumatic clamp at marking station
- Pre-Programmed - Just set the number of stops
