KWIK-DEX Programmable Dial Indexer

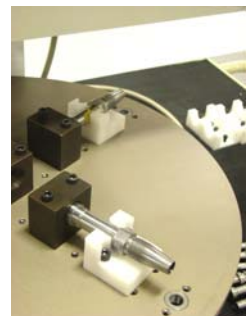

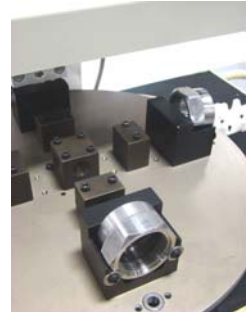

Machine tool quality construction

The Kwik-Dex programmable indexer is used to streamline your production by indexing parts to the marking area of the marker. This allows an operator to load/unload the dial while the machine is marking. Make your own dial or order from us.

Unlike a “generic” solution, this system includes an integrated clamp at the marking position. This means simpler fixturing requiring just a support to hold your parts during the index.

Manufactured by Kwikmark

Features:

- Ideal for families of products (quick changeover)
- Pre Programmed. Just set the number of stops
- No controller needed. Driven from marker's own software
- Fits onto optional T Slot table
- Built in pneumatic clamp at marking station
- Ergonomic operation
- No wiring required. Just one cord connection
- Built in home sensor and routine
