

Windows Software Suite Date Coding / Time Stamping

Automatic Date Coding

Any line may be set as a “DateCode” type. This will allow certain character strings to automatically mark the proper date & time values on your product. Consider the following time & date:

May 27 2005 3:52:00 PM

- YR =5 year
- YY =05 year
- YYYY =2005 year
- MN =52 minute
- MM =05 month
- MMM =MAY month
- Mmm =May month
- WY =22 week of the year
- DD =27 date
- DY =147 day of the year
- HR =03 hour am/pm
- HH =15 hour 24hr
- SS =00 second

Any number of lines, graphics and codes may be added to each marking file as well as characters separating the above codes.
ex: (- / : _ ;)

The Windows screen capture shows the file used in marking the image to the left.
